

Light and Heat

Ever metamorphosing to each other

Heat is light in complete repose. Light is heat in rapid motion.

From *The Secret Doctrine*, I p. 515 fn.; [quoting Sir John Leslie, *An Experimental Inquiry into the Nature and Properties of Heat*, 1804, p. 162.]

There is no fundamental difference between light and heat . . . each is merely a metamorphosis of the other. . . . Heat is light in complete repose. Light is heat in rapid motion. [When] directly light is combined with a body, it becomes heat; but when it is thrown off from that body it again becomes light.
